Share any specific tips that you have learned that may help others with Git commands or using GitHub for collaboration.

git status is always helpful for trouble shooting issues. If you ever find your git push not working for some reason, use git status. This will often tell you what you need to do next to resolve the issue, or if not, something you can google/research to find out what might be causing the problem. A second tip, if you ever find that your github repo is ahead of your local/master branch, do git pull. This should make it so that your repo has the same info as the github repo.

I have found that when using GitHub for collaboration branches are your friend. Making sure each team member has their own branch. When you commit your branch making sure that your comments reflect what was done. I also find making comments within the code as far as what was done can be helpful.

@Gary Fishback good tips... as we found out when our team collaborated. Its also nice that GitHub has good documentation. Plus with everyone doing YouTube videos helps as well.
